

Roll-out of 'UgandaEMR Mobile' Application to TASO Supported Facilities

Healthcare workers attending training

Uganda's health workers are now using the 'UgandaEMR Mobile' application to record patient data. The application is a mobile phone-based system that allows health workers to record patient data on their mobile phones. The application is designed to be user-friendly and easy to use, and it is being rolled out to health workers across the country.

The application is being used to support the implementation of the National Health Insurance Scheme (NHIS). The application will allow health workers to record patient data, such as patient name, age, sex, and medical history. This data will be used to generate reports and to monitor the health of the population.
